

This 400 square metre research facility was designed by the architect and constructed by KZA's construction arm, Zeko Design Build.

All of the materials for the building had to be flown in since the community has no road access. The building features a 12.1 KW grid-tied photo voltaic array, the largest PV installation in the Yukon. The PV array allows for substantial environmental benefits since the community is reliant on diesel-powered generators for all of its electrical needs.
